

- branch + at the crossing (20 runs per a)
- ▼ branch - at the crossing (18 runs per a)
- × same runs, initialisation-selected branch's T
- identity

(a) $a = 1.30$, budget 32k, $n = 38$ runs (post hoc, exploratory);
 branch at crossing: Spearman $\rho = 0.997$, bootstrap 95%
 $[0.9872, 0.9996]$; initialisation branch $\rho = 0.13$; own global
 threshold $\rho = 0.88$; median residual $\log(R/T) = 0.030$

(b) $a = 1.50$, budget 32k, $n = 38$ runs (post hoc, exploratory);
 branch at crossing: Spearman $\rho = 0.995$, bootstrap 95%
 $[0.9801, 0.9983]$; initialisation branch $\rho = 0.12$; own global
 threshold $\rho = 0.88$; median residual $\log(R/T) = 0.063$
