

Block 3: 8 held-out settings, $n = 86\text{--}88$ crossings of 90 each;
 λ fitted on the base window: $\lambda(1.30) = 1.115$, $\lambda(1.50) = 1.164$

- $C = \lambda(a) R_{\text{glob}}$ (λ fitted)
- $U = R_{\text{glob}}$ (nothing fitted)
- ▲ B1: base window's crossing $|w_2|$
- ◆ B2: pooled crossing R
- $U \rightarrow C$: fitted lag factor λ
- identity
