

- branch + at the crossing (20 runs per a) × same runs, initialisation-selected branch's T
- ▼ branch - at the crossing (18 runs per a) ---- identity

(a) $a = 1.30$: Spearman $\rho = 0.997$ [0.9872, 0.9996]

(b) $a = 1.50$: Spearman $\rho = 0.995$ [0.9801, 0.9983]

Post hoc, exploratory. Free-training crossings, budget 32k; T as $R = |w_2|\hat{G}/2$; titles: ρ with the branch occupied at the crossing, bootstrap 95%.

(a) $n = 38$ runs; initialisation branch $\rho = 0.13$; own global threshold $\rho = 0.88$; median residual $\log(R/T) = 0.030$;

(b) $n = 38$ runs; initialisation branch $\rho = 0.12$; own global threshold $\rho = 0.88$; median residual $\log(R/T) = 0.063$.
